Application 1455 (18.02.2016)

**Description EN**

The invention relates to the continuous distillation equipment. The design of the invention enables continuous use of the equipment at fermented mash distillation and at periodic distillation. The essence of the proposed invention is increasing the efficiency of extracting ethanol from brewed mash, reducing energy costs in the production process, simplifying construction, mobility facility, decreasing the cost of the equipment. Distillation equipments designed for continuous and periodic fermented mash distillation to obtain bioethanol as a fuel for internal combustion engines.

**Class no.**

5. Industrial and laboratory equipments
